QUESTION BANK

1. Write the name of the following and give their functions:
a. Cell wall (cellulose, lignin) - structure
b. Plasma membrane - structure, function

Questions for Oral Answers

1. What is the function of the cell wall in a plant cell?
It provides structural support and protection against mechanical damage and pathogens. It is made of cellulose and lignin.
2. What is the function of the plasma membrane in a cell?
It acts as a barrier between the cell and its environment, regulating the movement of substances in and out of the cell.
3. What are the differences between a plant cell and an animal cell?
Plant cells have a cell wall, large central vacuole, and chloroplasts. Animal cells lack these structures.
4. What is the function of the central vacuole in a plant cell?
It maintains turgor pressure, stores nutrients, and helps in the degradation of waste products.
5. What is the function of the chloroplast in a plant cell?
It is the site of photosynthesis, where light energy is converted into chemical energy in the form of glucose.
6. What is the function of the nucleus in a cell?
It contains the cell's genetic material (DNA) and controls the cell's activities.
7. What is the function of the cytoplasm in a cell?
It is a fluid medium where organelles are suspended and where most cellular activities occur.
8. What is the function of the Golgi apparatus in a cell?
It is involved in the synthesis, modification, and transport of proteins and lipids.
9. What is the function of the lysosome in a cell?
It contains digestive enzymes that break down waste materials and cellular debris.
10. What is the function of the mitochondrion in a cell?
It is the site of cellular respiration, where energy from nutrients is converted into ATP.
11. What is the function of the ribosome in a cell?
It is the site of protein synthesis, where amino acids are joined together to form polypeptides.
